Instructor: Tony Jebara

Topic 20

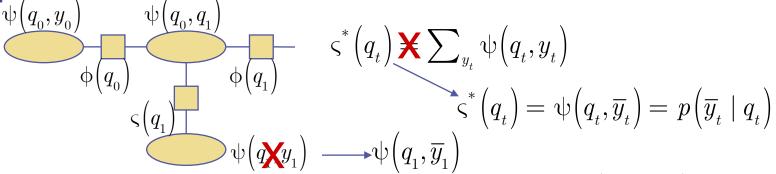

- HMMs with Evidence
- •HMM Collect
- HMM Evaluate
- •HMM Distribute
- •HMM Decode
- •HMM Parameter Learning via JTA & EM

HMMs: JTA with Evidence

•If y sequence is observed (in problems 1,2,3) get evidence:

$$p\!\left(q,\overline{y}\right) = p\!\left(q_{\scriptscriptstyle 0}\right) \!\prod\nolimits_{\scriptscriptstyle t=1}^{\scriptscriptstyle T} p\!\left(q_{\scriptscriptstyle t} \mid q_{\scriptscriptstyle t-1}\right) \!\!\prod\nolimits_{\scriptscriptstyle t=0}^{\scriptscriptstyle T} p\!\left(\overline{y}_{\scriptscriptstyle t} \mid q_{\scriptscriptstyle t}\right)$$

The potentials turn into slices:

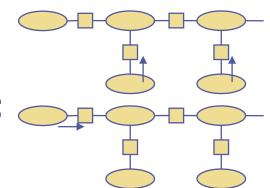

- •Next, pick a root, for example $\emph{rightmost}$ one: $\psiig(q_{T-1},q_{T}ig)$
- Collect all zeta separators bottom up:

$$\boldsymbol{\varsigma}^* \left(\boldsymbol{q}_{\scriptscriptstyle t} \right) = \boldsymbol{\psi} \left(\boldsymbol{q}_{\scriptscriptstyle t}, \overline{\boldsymbol{y}}_{\scriptscriptstyle t} \right) = \boldsymbol{p} \left(\overline{\boldsymbol{y}}_{\scriptscriptstyle t} \mid \boldsymbol{q}_{\scriptscriptstyle t} \right)$$

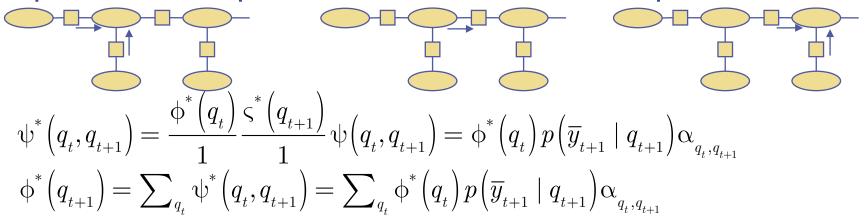

Collect leftmost phi separator to the right:

$$\boldsymbol{\varphi}^* \left(\boldsymbol{q_{\scriptscriptstyle 0}} \right) = \sum\nolimits_{\boldsymbol{y_{\scriptscriptstyle 0}}} \boldsymbol{\psi} \left(\boldsymbol{q_{\scriptscriptstyle 0}}, \overline{\boldsymbol{y}_{\scriptscriptstyle 0}} \right) \boldsymbol{\delta} \left(\boldsymbol{y_{\scriptscriptstyle 0}} - \overline{\boldsymbol{y}_{\scriptscriptstyle 0}} \right) = \, p \left(\overline{\boldsymbol{y}_{\scriptscriptstyle 0}}, \boldsymbol{q_{\scriptscriptstyle 0}} \right)$$

HMMs: Collect with Evidence

- Now, we will collect (*) along the backbone left to right
- •Update each clique with its left and bottom separators:

- Keep going along chain until right most node
- Note: above formula for phi is recursive, could use as is.

$$\begin{split} \bullet \text{Property: recall we had} & \quad \varphi^* \left(q_0 \right) = p \left(\overline{y}_0, q_0 \right) \\ & \quad \varphi^* \left(q_1 \right) = \sum_{q_0} p \left(\overline{y}_0, q_0 \right) p \left(\overline{y}_1 \mid q_1 \right) p \left(q_1 \mid q_0 \right) = p \left(\overline{y}_0, \overline{y}_1, q_1 \right) \\ & \quad \varphi^* \left(q_2 \right) = \sum_{q_1} p \left(\overline{y}_0, \overline{y}_1, q_1 \right) p \left(\overline{y}_2 \mid q_2 \right) p \left(q_2 \mid q_1 \right) = p \left(\overline{y}_0, \overline{y}_1, \overline{y}_2, q_2 \right) \\ & \quad \varphi^* \left(q_{t+1} \right) = \sum_{q_t} p \left(\overline{y}_0, \dots, \overline{y}_t, q_t \right) p \left(\overline{y}_{t+1} \mid q_{t+1} \right) p \left(q_{t+1} \mid q_t \right) = p \left(\overline{y}_0, \dots, \overline{y}_{t+1}, q_{t+1} \right) \end{split}$$

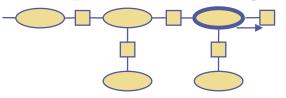

HMMs: Evaluate with Evidence

- •Say we are solving the first HMM problem:
 - 1) Evaluate: given $y_0,...,y_T \& \theta$ compute $p(y_0,...,y_T|\theta)$
- •If we want to compute the likelihood, we are already done!
- •We really just need to do collect (not even distribute).
- •From previous slide we had:

$$\boldsymbol{\varphi}^* \left(\boldsymbol{q}_{t+1}\right) = \sum\nolimits_{\boldsymbol{q}_t} p \left(\overline{\boldsymbol{y}}_{\!\scriptscriptstyle 0}, \ldots, \overline{\boldsymbol{y}}_{\!\scriptscriptstyle t}, \boldsymbol{q}_{\!\scriptscriptstyle t}\right) p \left(\overline{\boldsymbol{y}}_{\!\scriptscriptstyle t+1} \mid \boldsymbol{q}_{t+1}\right) p \left(\boldsymbol{q}_{t+1} \mid \boldsymbol{q}_{\!\scriptscriptstyle t}\right) = p \left(\overline{\boldsymbol{y}}_{\!\scriptscriptstyle 0}, \ldots, \overline{\boldsymbol{y}}_{\!\scriptscriptstyle t+1}, \boldsymbol{q}_{t+1}\right)$$

•As we collect to the root (rightmost node), we finally get:

$$\boldsymbol{\varphi}^* \left(\boldsymbol{q}_T \right) = p \left(\overline{y}_0, \dots, \overline{y}_T, \boldsymbol{q}_T \right)$$

Can compute the likelihood just by marginalizing this phi

$$p\left(\overline{y}_{0},\ldots,\overline{y}_{T}\right) = \sum\nolimits_{q_{T}} p\left(\overline{y}_{0},\ldots,\overline{y}_{T},q_{T}\right) = \sum\nolimits_{q_{T}} \boldsymbol{\varphi}^{*}\left(q_{T}\right)$$

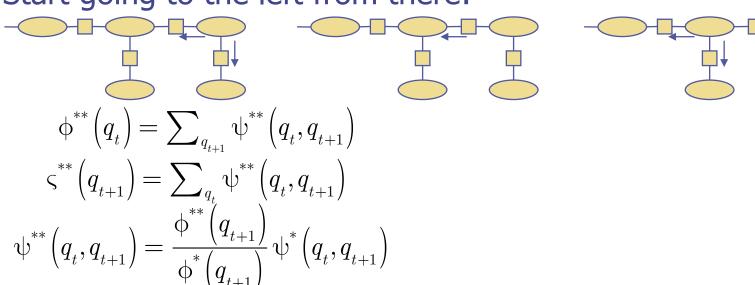

•So, adding up the entries in last ϕ^* gives us the likelihood

HMMs: Distribute with Evidence

•Back to collecting... say just finished collecting to the root with our last update formula:

$$\boldsymbol{\psi}^*\left(\boldsymbol{q}_{T-1},\boldsymbol{q}_{T}\right) = \frac{\boldsymbol{\varphi}^*\left(\boldsymbol{q}_{T-1}\right)}{1} \frac{\boldsymbol{\varsigma}^*\left(\boldsymbol{q}_{T}\right)}{1} \boldsymbol{\psi}\left(\boldsymbol{q}_{T-1},\boldsymbol{q}_{T}\right) = \boldsymbol{\varphi}^*\left(\boldsymbol{q}_{T-1}\right) \boldsymbol{p}\left(\overline{\boldsymbol{y}}_{T} \mid \boldsymbol{q}_{T}\right) \boldsymbol{\alpha}_{\boldsymbol{q}_{T-1},\boldsymbol{q}_{T}}$$

- •Now, we distribute (**) along the backbone right to left
- •Have first ** for root (stays the same): $\psi^{**}(q_{T-1},q_T) = \psi^*(q_{T-1},q_T)$
- •Start going to the left from there:

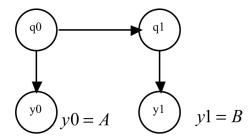

HMM Example

You are given the parameters of a 2-state HMM. You observed the input sequence AB (from a 2-symbol alphabet A or B). In other words, you observe two symbols from your finite state machine, A and then B. Using the junction tree algorithm, evaluate the likelihood of this data p(y) given your HMM and its parameters. Also compute (for decoding) the individual marginals of the states after the evidence from this sequence is observed: $p(q_0|y)$ and $p(q_1|y)$. The parameters for the HMM are provided below. They are the initial state prior $p(q_0)$, the state transition matrix given by $p(q_t|q_{t-1})$, and the emission matrix $p(y_t|q_t)$, respectively.

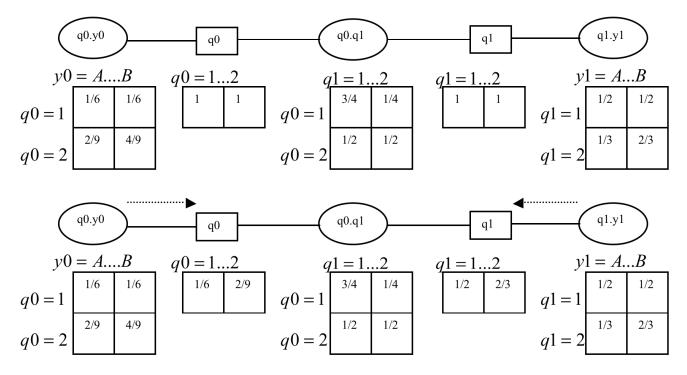

$$\pi = p(q_0) = \begin{bmatrix} 1 & 2 \\ 1/3 & 2/3 \end{bmatrix}$$

$$a^{T} = p(q_{t} | q_{t-1}) = \begin{bmatrix} 3/4 & 1/2 \\ 1/4 & 1/2 \end{bmatrix} \qquad \eta^{T} = p(y_{t} | q_{t}) = \begin{bmatrix} 1/2 & 1/3 \\ B & 1/2 & 2/3 \end{bmatrix}$$

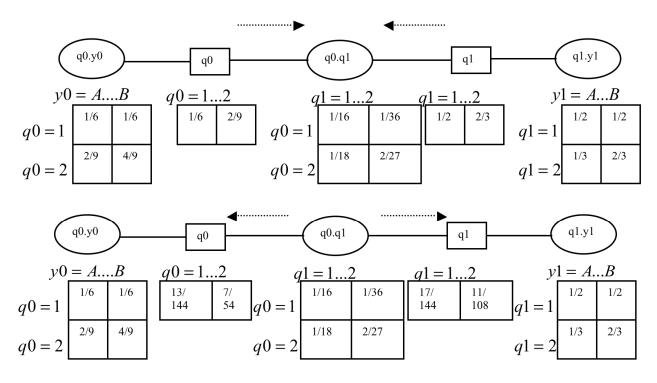

HMM Example

Initialized Junction Tree

HMM Example

So the likelihood
$$p(y) = \frac{13}{144} + \frac{7}{54} = \frac{1}{16} + \frac{1}{18} + \frac{1}{36} + \frac{2}{27} = \frac{17}{144} + \frac{11}{108} = \frac{95}{432} = 0.2199$$

$$p(q_0 = 1 \mid y) = \frac{13/144}{13/144 + 7/54} = \frac{39}{95}, \ p(q_0 = 2 \mid y) = \frac{7/54}{13/144 + 7/54} = \frac{56}{95}$$

$$p(q_1 = 1 \mid y) = \frac{17/144}{17/144 + 11/108} = \frac{51}{95}, \ p(q_1 = 2 \mid y) = \frac{11/108}{17/144 + 11/108} = \frac{44}{95}$$

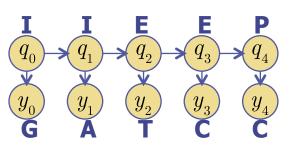

HMMs: Marginals & MaxDecoding

•Now that JTA is finished, we have the following:

$$\begin{split} & \boldsymbol{\varphi}^{**}\left(\boldsymbol{q}_{t}\right) \propto \, p\left(\boldsymbol{q}_{t} \mid \overline{\boldsymbol{y}}_{1}, \ldots, \overline{\boldsymbol{y}}_{T}\right) & \boldsymbol{\varsigma}^{**}\left(\boldsymbol{q}_{t+1}\right) \propto \, p\left(\boldsymbol{q}_{t+1} \mid \overline{\boldsymbol{y}}_{1}, \ldots, \overline{\boldsymbol{y}}_{T}\right) \\ & \boldsymbol{\psi}^{**}\left(\boldsymbol{q}_{t}, \boldsymbol{q}_{t+1}\right) \propto \, p\left(\boldsymbol{q}_{t}, \boldsymbol{q}_{t+1} \mid \overline{\boldsymbol{y}}_{1}, \ldots, \overline{\boldsymbol{y}}_{T}\right) \end{split}$$

- •We have done part of the HMM Problem:
 - 2) Decode: given $y_0,...,y_T \& \theta$ find $p(q_0),...,p(q_T)$ and $q_0,...,q_T$
- •The separators define a distribution over the hidden states
- •This gives the probability the DNA symbol y_t was $q_t = \{I, E, P\}$
- •We can also decode to find the most likely path q₀ ... q_T
- •Here, we use the ArgMax JTA algorithm
- •Run JTA but replace sums with max
- •Then, find biggest entry in separators:

$$\hat{q}_{t} = \operatorname{arg\,max}_{q_{t}} \phi^{**}(q_{t}) \quad \forall t = 0...T$$

- •Finally 3) Max Likelihood: given $y_0,...,y_T$ learn parameters θ
- •Recall max likelihood: $\hat{\theta} = \arg \max_{\theta} \log p(\overline{y} \mid \theta)$
- •If observe q, it's easy to maximize the complete likelihood:

$$\begin{split} l\left(\theta\right) &= \log\left(p\left(q,y\right)\right) \\ &= \log\left(p\left(q_{0}\right)\prod_{t=1}^{T}p\left(q_{t}\mid q_{t-1}\right)\prod_{t=0}^{T}p\left(\overline{y}_{t}\mid q_{t}\right)\right) \\ &= \log p\left(q_{0}\right) + \sum_{t=1}^{T}\log p\left(q_{t}\mid q_{t-1}\right) + \sum_{t=0}^{T}\log p\left(\overline{y}_{t}\mid q_{t}\right) \\ &= \log\prod_{i=1}^{M}\left[\pi_{i}\right]^{q_{0}^{i}} + \sum_{t=1}^{T}\log\prod_{i=1}^{M}\prod_{j=1}^{M}\left[\alpha_{ij}\right]^{q_{t-1}^{i}q_{t}^{j}} + \sum_{t=0}^{T}\log\prod\prod_{i=1}^{M}\prod_{j=1}^{N}\left[\eta_{ij}\right]^{q_{t}^{i}y_{t}^{j}} \\ &= \sum_{i=1}^{M}q_{0}^{i}\log\pi_{i} + \sum_{t=1}^{T}\sum_{i,j=1}^{M}q_{t-1}^{i}q_{t}^{j}\log\alpha_{ij} + \sum_{t=0}^{T}\sum_{i=1}^{M}\sum_{j=1}^{N}q_{t}^{i}y_{t}^{j}\log\eta_{ij} \end{split}$$

Introduce Lagrange $\longrightarrow \sum_{i=1}^{M} \pi_i = 1$ $\sum_{i=1}^{M} \alpha_{ii} = 1$ $\sum_{i=1}^{N} \eta_{ii} = 1$ & take derivatives

$$\hat{\pi}_i = q_0^i$$

$$\hat{\pi}_{i} = q_{0}^{i} \qquad \hat{\alpha}_{ij} = \frac{\sum_{t=0}^{T-1} q_{t}^{i} q_{t+1}^{j}}{\sum_{t=0}^{M} \sum_{t=0}^{T-1} q_{t}^{i} q_{t+1}^{k}} \qquad \hat{\eta}_{ij} = \frac{\sum_{t=0}^{T} q_{t}^{i} y_{t}^{j}}{\sum_{t=0}^{N} \sum_{t=0}^{T} q_{t}^{i} y_{t}^{k}}$$

$$\hat{\eta}_{ij} = \frac{\sum_{t=0}^{T} q_t^i y_t^j}{\sum_{k=1}^{N} \sum_{t=0}^{T} q_t^i y_t^k}$$

•But, we don't observe the q's, incomplete...

$$p\!\left(\overline{y}\mid\theta\right) = \sum\nolimits_{\boldsymbol{q}} p\!\left(\boldsymbol{q},\overline{y}\mid\theta\right) = \sum\nolimits_{\boldsymbol{q}_0} \cdots \sum\nolimits_{\boldsymbol{q}_T} p\!\left(\boldsymbol{q}_0\right) \prod\nolimits_{t=1}^{T} p\!\left(\boldsymbol{q}_t\mid\boldsymbol{q}_{t-1}\right) \!\prod\nolimits_{t=0}^{T} p\!\left(\overline{y}_t\mid\boldsymbol{q}_t\right)$$

•EM: Max expected complete likelihood given current p(q)

$$\begin{split} E\left\{l\left(\theta\right)\right\} &= E_{p\left(q_{0},...,q_{T}|y\right)}\left\{\log p\left(q,y\right)\right\} = \sum_{q_{0}}...\sum_{q_{T}}p\left(q\mid y\right)\log p\left(q,y\right)\\ &= E\left\{\sum_{i=1}^{M}q_{0}^{i}\log\pi_{i} + \sum_{t=1}^{T}\sum_{i,j=1}^{M}q_{t-1}^{i}q_{t}^{j}\log\alpha_{ij} + \sum_{t=0}^{T}\sum_{i=1}^{M}\sum_{j=1}^{N}q_{t}^{i}y_{t}^{j}\log\eta_{ij}\right\}\\ &= \sum_{i=1}^{M}E\left\{q_{0}^{i}\right\}\log\pi_{i} + \sum_{t=1}^{T}\sum_{i,j=1}^{M}E\left\{q_{t-1}^{i}q_{t}^{j}\right\}\log\alpha_{ij} + \sum_{t=0}^{T}\sum_{i=1}^{M}\sum_{j=1}^{N}E\left\{q_{t}^{i}\right\}y_{t}^{j}\log\eta_{ij} \end{split}$$

M-step is maximizing as before:

$$\hat{\pi}_{i} = E\left\{q_{0}^{i}\right\} \qquad \hat{\alpha}_{ij} = \frac{\sum_{t=0}^{T-1} E\left\{q_{t}^{i} q_{t+1}^{j}\right\}}{\sum_{k=1}^{M} \sum_{t=0}^{T-1} E\left\{q_{t}^{i} q_{t+1}^{k}\right\}} \qquad \hat{\eta}_{ij} = \frac{\sum_{t=0}^{T} E\left\{q_{t}^{i}\right\} y_{t}^{j}}{\sum_{k=1}^{N} \sum_{t=0}^{T} E\left\{q_{t}^{i}\right\} y_{t}^{k}}$$

•What are E{}'s?

•But, we don't observe the q's, incomplete...

$$p\!\left(\overline{y}\mid\theta\right) = \sum\nolimits_{\boldsymbol{q}} p\!\left(\boldsymbol{q},\overline{y}\mid\theta\right) = \sum\nolimits_{\boldsymbol{q}_0} \cdots \sum\nolimits_{\boldsymbol{q}_T} p\!\left(\boldsymbol{q}_0\right) \prod\nolimits_{t=1}^{T} p\!\left(\boldsymbol{q}_t\mid\boldsymbol{q}_{t-1}\right) \!\prod\nolimits_{t=0}^{T} p\!\left(\overline{y}_t\mid\boldsymbol{q}_t\right)$$

•EM: Max expected complete likelihood given current p(q)

$$\begin{split} E\left\{l\left(\theta\right)\right\} &= E_{p\left(q_{0},...,q_{T}|y\right)} \Big\{\log p\left(q,y\right)\Big\} = \sum_{q_{0}} ... \sum_{q_{T}} p\left(q\mid y\right) \log p\left(q,y\right) \\ &= E\Big\{\sum_{i=1}^{M} q_{0}^{i} \log \pi_{i} + \sum_{t=1}^{T} \sum_{i,j=1}^{M} q_{t-1}^{i} q_{t}^{j} \log \alpha_{ij} + \sum_{t=0}^{T} \sum_{i=1}^{M} \sum_{j=1}^{N} q_{t}^{i} y_{t}^{j} \log \eta_{ij} \Big\} \\ &= \sum_{i=1}^{M} E\left\{q_{0}^{i}\right\} \log \pi_{i} + \sum_{t=1}^{T} \sum_{i,j=1}^{M} E\left\{q_{t-1}^{i} q_{t}^{j}\right\} \log \alpha_{ij} + \sum_{t=0}^{T} \sum_{i=1}^{M} \sum_{j=1}^{N} E\left\{q_{t}^{i}\right\} y_{t}^{j} \log \eta_{ij} \end{split}$$

M-step is maximizing as before:

$$\hat{\pi}_{i} = E\left\{q_{0}^{i}\right\} \qquad \hat{\alpha}_{ij} = \frac{\sum_{t=0}^{T-1} E\left\{q_{t}^{i} q_{t+1}^{j}\right\}}{\sum_{k=1}^{M} \sum_{t=0}^{T-1} E\left\{q_{t}^{i} q_{t+1}^{k}\right\}} \qquad \hat{\eta}_{ij} = \frac{\sum_{t=0}^{T} E\left\{q_{t}^{i}\right\} y_{t}^{j}}{\sum_{k=1}^{N} \sum_{t=0}^{T} E\left\{q_{t}^{i}\right\} y_{t}^{k}}$$
•What are E{}}'s?
$$E_{p(x)}\left\{x^{i}\right\} = \sum_{x} p(x) x^{i} = \sum_{x} p(x) \delta(x = x^{i}) = p(x^{i})$$

•But, we don't observe the q's, incomplete...

$$p\!\left(\overline{y}\mid\theta\right) = \sum\nolimits_{\boldsymbol{q}} p\!\left(\boldsymbol{q},\overline{y}\mid\theta\right) = \sum\nolimits_{\boldsymbol{q}_0} \cdots \sum\nolimits_{\boldsymbol{q}_T} p\!\left(\boldsymbol{q}_0\right) \prod\nolimits_{t=1}^{T} p\!\left(\boldsymbol{q}_t\mid\boldsymbol{q}_{t-1}\right) \!\prod\nolimits_{t=0}^{T} p\!\left(\overline{y}_t\mid\boldsymbol{q}_t\right)$$

•EM: Max expected complete likelihood given current p(q)

$$\begin{split} E\left\{l\left(\theta\right)\right\} &= E_{p\left(q_{0},...,q_{T}|y\right)}\left\{\log p\left(q,y\right)\right\} = \sum_{q_{0}}...\sum_{q_{T}}p\left(q\mid y\right)\log p\left(q,y\right)\\ &= E\left\{\sum_{i=1}^{M}q_{0}^{i}\log\pi_{i} + \sum_{t=1}^{T}\sum_{i,j=1}^{M}q_{t-1}^{i}q_{t}^{j}\log\alpha_{ij} + \sum_{t=0}^{T}\sum_{i=1}^{M}\sum_{j=1}^{N}q_{t}^{i}y_{t}^{j}\log\eta_{ij}\right\}\\ &= \sum_{i=1}^{M}E\left\{q_{0}^{i}\right\}\log\pi_{i} + \sum_{t=1}^{T}\sum_{i,j=1}^{M}E\left\{q_{t-1}^{i}q_{t}^{j}\right\}\log\alpha_{ij} + \sum_{t=0}^{T}\sum_{i=1}^{M}\sum_{j=1}^{N}E\left\{q_{t}^{i}\right\}y_{t}^{j}\log\eta_{ij} \end{split}$$

M-step is maximizing as before:

$$\hat{\pi}_{i} = E\left\{q_{0}^{i}\right\} \qquad \hat{\alpha}_{ij} = \frac{\sum_{t=0}^{T-1} E\left\{q_{t}^{i} q_{t+1}^{j}\right\}}{\sum_{k=1}^{M} \sum_{t=0}^{T-1} E\left\{q_{t}^{i} q_{t+1}^{k}\right\}} \qquad \hat{\eta}_{ij} = \frac{\sum_{t=0}^{T} E\left\{q_{t}^{i}\right\} y_{t}^{j}}{\sum_{k=1}^{N} \sum_{t=0}^{T} E\left\{q_{t}^{i}\right\} y_{t}^{k}}$$

- •What are E{}'s? $E_{p(x)}\{x^i\} = \sum_x p(x)x^i = \sum_x p(x)\delta(x=x^i) = p(x^i)$
- •Our JTA ψ & ϕ marginals! (JTA is the E-Step for given θ)

$$E\left\{q_{\scriptscriptstyle t}^{\scriptscriptstyle i}q_{\scriptscriptstyle t+1}^{\scriptscriptstyle j}\right\} = p\left(q_{\scriptscriptstyle t}=i,q_{\scriptscriptstyle t+1}=j\mid\overline{y}\right) \propto \psi^{**}\left(q_{\scriptscriptstyle t},q_{\scriptscriptstyle t+1}\right) \quad E\left\{q_{\scriptscriptstyle t}^{\scriptscriptstyle i}\right\} = p\left(q_{\scriptscriptstyle t}=i\mid\overline{y}\right) \propto \varphi^{**}\left(q_{\scriptscriptstyle t}\right) = p\left(q_{\scriptscriptstyle t}=i\mid\overline{y}\right) \propto \varphi^{**}\left(q_{\scriptscriptstyle t}\right) = p\left(q_{\scriptscriptstyle t}=i\mid\overline{y}\right) = p\left(q_{\scriptscriptstyle t}=i\mid$$

Thank you!

- Please complete course evaluation on courseworks
- Good luck with finals week and happy holidays!
